

Ashland Reservoir Tank 2 Roof Slab Concrete Pour

Dear Resident,

The time has come for the Ashland Reservoir Tank Replacement Projects second big concrete pour. The concrete placement for the first tanks roof deck is requiring roughly 1500 Cubic Yards of concrete. This large amount of concrete requires WSCI to reserve our concrete supplier's batch plant for the whole day. Since this placement of concrete is so large and the days are hot, we will begin placing concrete at 5:00 AM. This will require set up of the pump trucks prior to this time. The City of Wheat Ridge has granted WSCI and our concrete subcontractor to pour our first tanks roof deck this Monday, August 18.

Due to the small amount of available space around the project site, driving restrictions will be set in place for the day. Fenton St. between 29th avenue and 30th avenue will be limited to one way traffic north bound and no parking will be allowed on the west side of the street. 30th Avenue between Gray St. and Harlan St will be limited to one way traffic west bound and no public parking will be available. Harlan St. between 30th Avenue and 32nd Avenue will be limited to one way traffic north bound. Also, there will be no parking on the North side of 29th St. between Depew St. and Fenton St.

A viewing station will be set up for the public on the corner of 30th Avenue and Gray St for local residents and guests to observe the concrete placement. The viewing station will be in-between the existing East Basin, and the new under construction West Tank. If you have any questions regarding the concrete placement or Ashland Project in general, please do not hesitate to call the Ashland Community Relations Representative Mike Finucan. WSCI appreciates your cooperation and understanding.

Thanks, and have a great day.

Mike Finucan
